Ultimate Backgrounds Collection

by CraftPix with the partnership of Krawper

First of all, thank you for downloading this asset !

No other packages, apart from those installed by default by Unity, are required to make this asset work correctly. However, it is recommended to have an up-to-date or recent version of Unity.

How to use it

After importing the asset via the Package Manager, go to the **Scenes** folder and select a scene to try it out ! The 280 scenes are divided into 64 packs, themselves divided into 7 major collections.

Player

When play mode is enabled, use the **Arrow keys** on your keyboard to move the player forward. Press the **Space key** to jump. You can change the **Speed** and the **Jump force** in the inspector.

You can also enable **Endless Move** so that the player moves right indefinitely.

If you activate **Fly Mode**, the player will no longer be subject to gravity and you will also be able to move him on the vertical axis with the **Arrow keys**.

Main Camera

In some scenes the camera can only follow the player on the horizontal axis, so it is not recommended to unlock the **LockVerticalAxis** and **LockCameraSize** variables in the MainCamera inspector.

But, if this is the case with your asset, some scenes have an "infinite sky", so the camera can follow the player on the vertical axis and you can increase its size and adjust the vertical offset.

Uncheck the **Smooth Camera** box if you don't want a smooth effect.

Background

Background is composed of several layers, each composed of the **ParallaxEffect** script.

The parallax effect is a technique used in 2D video games to create the illusion of depth and dimension in a two-dimensional environment. It involves moving background elements at different speeds, simulating the effect we observe in reality when we move our heads.

We do not recommend changing the default settings of these scripts. If you have done so, find your background in the **Prefabs** and import it into your scene, and delete the old one.

Locate a scene quickly

This ultimate collection contains a very large number of 280 scenes, so it can be very difficult to quickly find the scene(s) you are looking for.

To help you, you will find a **Scene Names** image within each collection in the **Scenes** folder. This is a gallery of all the backgrounds in that collection, along with their names.

You can then use the small search bar in the **Project** window by simply typing the name of the scene (don't forget the underscores "_") to bring up the scene, its prefab and its PNG images !

Grounded and Fly Mode scenes

Some collections features two types of scenes : **Grounded Mode** and **Fly Mode**.

Grounded Mode scenes are ideal if you want to develop a simple platform game.

But if you prefer to create a game where you control a bird, a plane or a spaceship, for example, you can choose **Fly Mode** scenes, where **Fly Mode** and **Endless Move** are enabled by default.

You can, of course, enable and disable these features at any time via the Player inspector.

Also note that the Underwater packs in the **Bonus Collection** have scenes called **Swim Mode**, but they use the same scripts and mechanics as **Fly Mode**.

Import a background into an existing scene

Grounded Mode scenes

Find the background you want in the **Prefabs** folder and drag and drop it into your scene.

If you haven't already, remember to add the "Player" tag to your new player and adjust their position so they are directly on the ground when the game starts.

Finally, add the **MainCamera** script to your camera and adjust the **Background Color**.

Fly Mode scenes

For Fly Mode scenes, it's recommended to reuse the entire scene as is.

You simply need to replace the default Player sprite with your own. To do this, open the player inspector and drag your new player sprite into the Sprite Renderer.

Road Pack Scenes

You may notice a **Road Pack** folder present in the **Prefabs** and **Scripts** folders.

The Road Pack, located in the **Bonus Collection**, features 4 unique scenes that differ from the others because you directly control the vehicles within the scenes.

Therefore, this pack requires adapted prefabs and scripts to function correctly.

Contacts and supports

We hope this asset will bring value to your Unity game projects !

If you have not found the answer(s) you are looking for, or if you notice bugs or other issues, do not hesitate to contact **Krawper**, the developer of this asset, via his Discord profile.

If you have more general questions regarding **CraftPix** and its other assets and licenses, please contact us directly through our online support : https://craftpix.net/support/
